

Landscape Printing from CREATE to Your Epson Printer – Mac Version

By Sandy McCauley

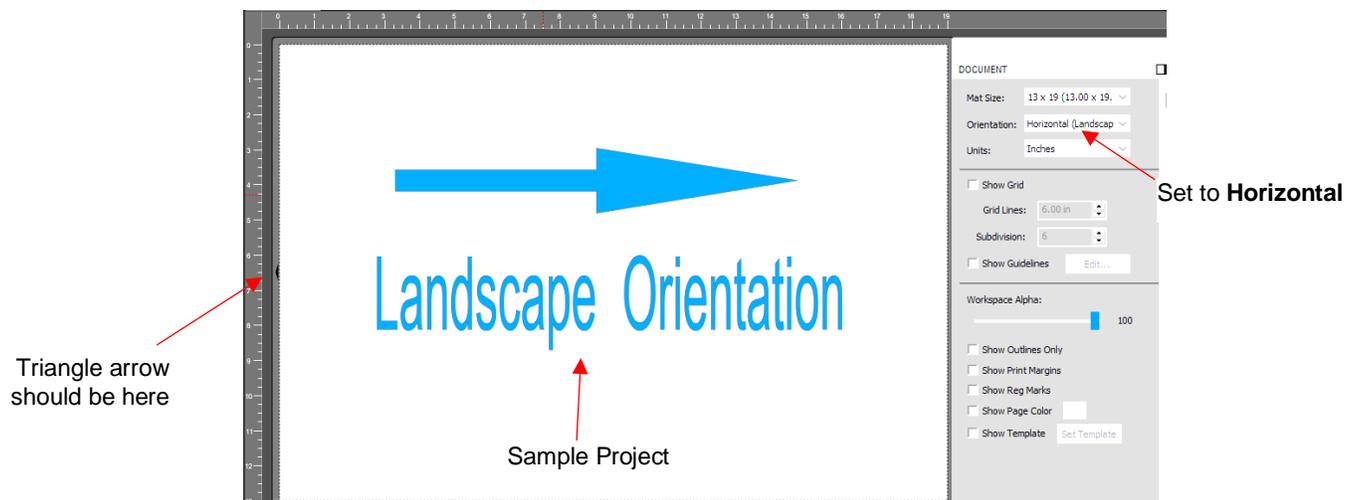

August 3, 2022

1. On the **Document Panel**, change the **Mat Size** to match the dimensions of the **material** you're planning to print on. Note that if you are creating a custom size that's not part of your printer's menu options, then please go through [these two documents](#), as well:

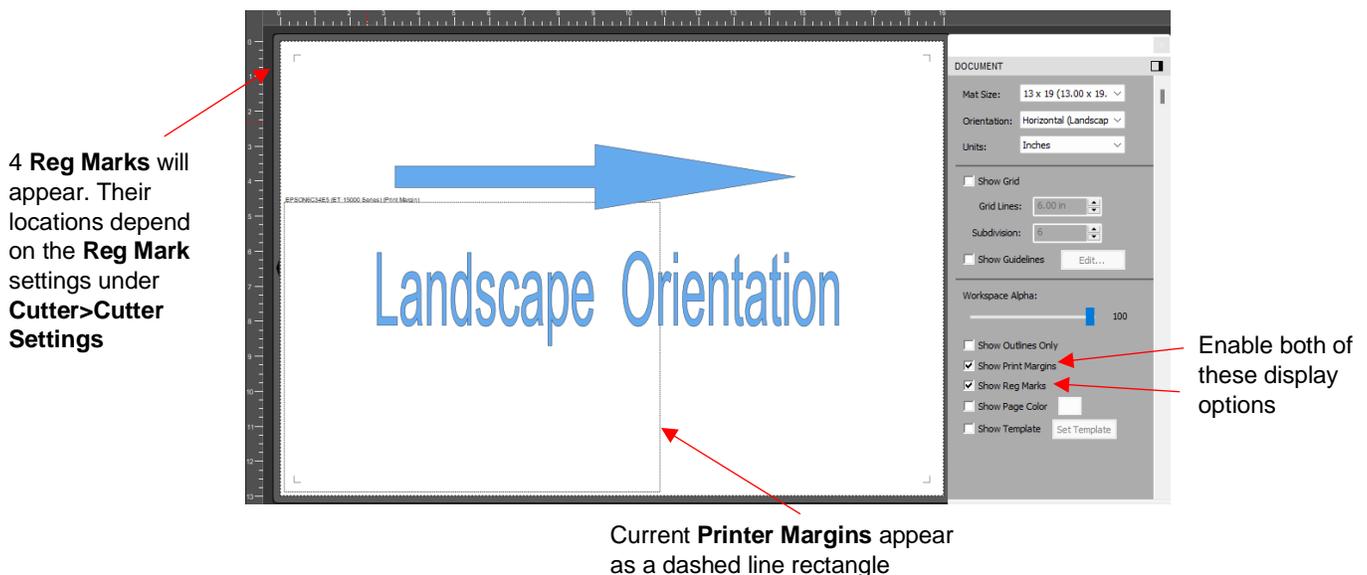

[Custom Mat Size](#) (go to *Section 1.06.1*)

[Custom Epson Printer Document Setup](#)

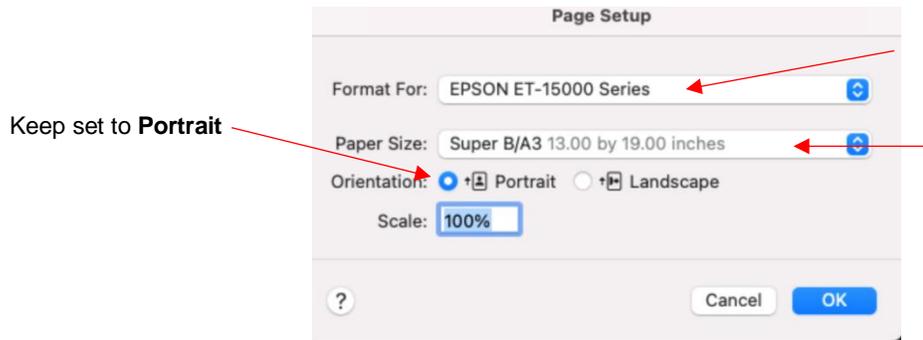

2. On the **Document Panel**, set the **Orientation** to **Horizontal (Landscape)** and arrange your project accordingly:

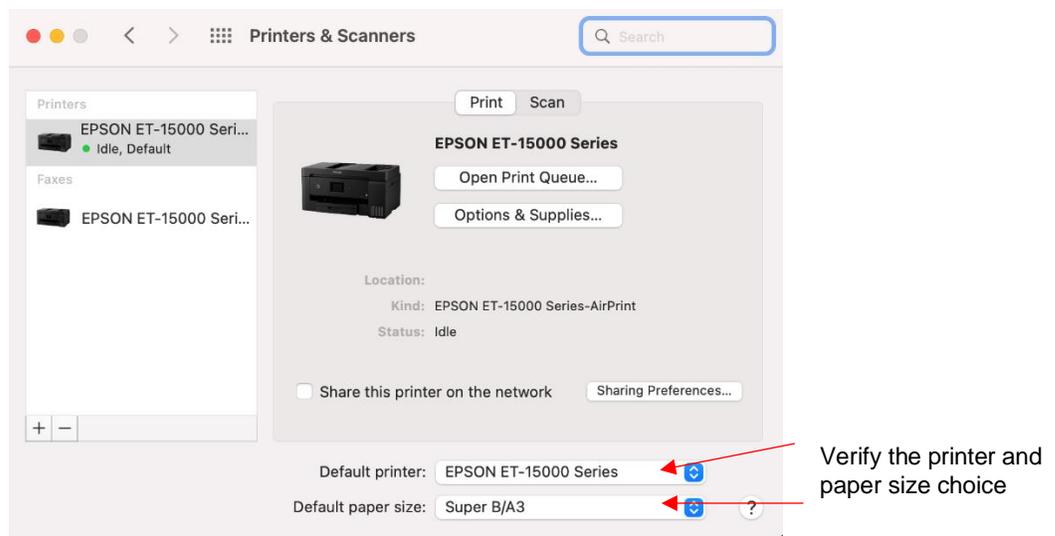

3. Turn on **Show Print Margins** and **Show Reg Marks**. Depending on the initial **Printer** and **Reg Mark Settings**, these may not yet be in the correct locations:

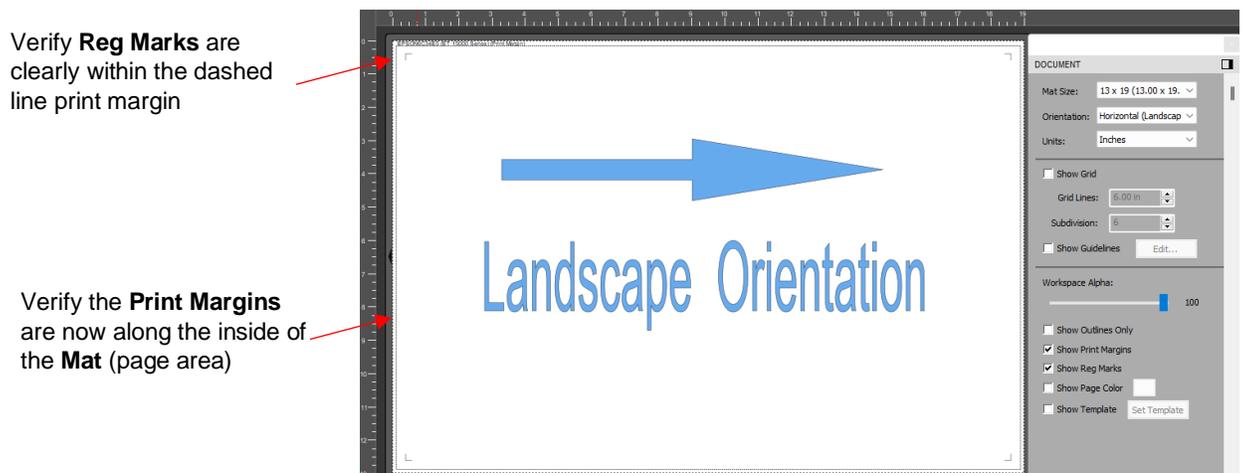

- Go to **File>Page Setup** and select your **Printer, Paper Size, and Orientation**. **IMPORTANT** – Even though you have set the **Mat Size** to **Landscape**, you want to leave the **Orientation** set to **Portrait**:

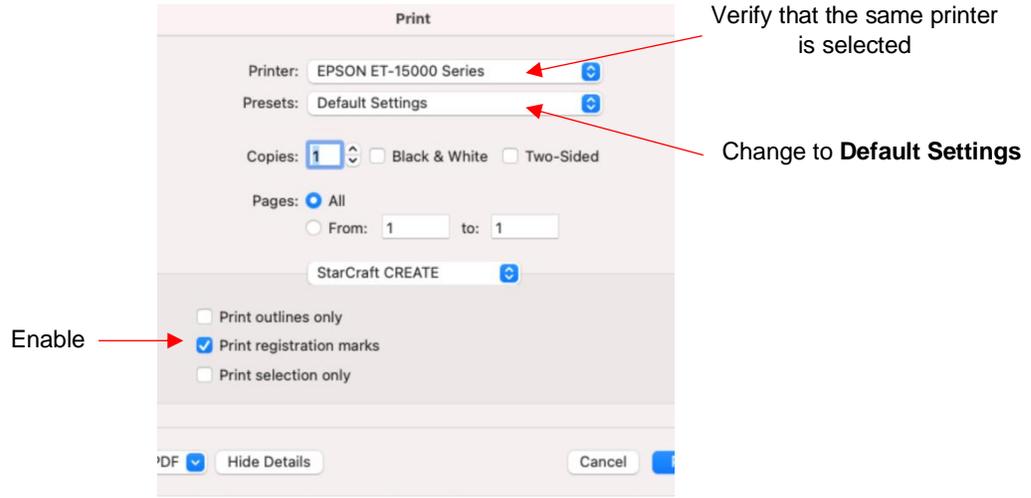

- In the same drop-down menu where you selected your printer, now select **Printers & Scanners Preferences** to open its window. Change the **Default paper size** to the newly created paper size:

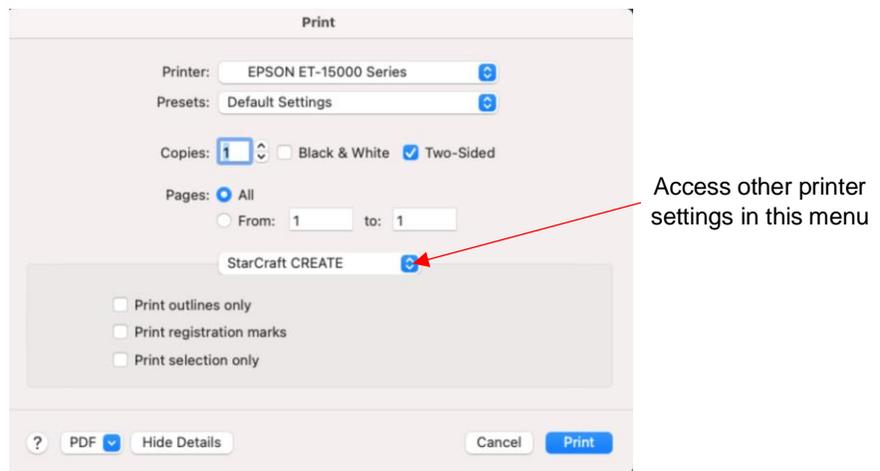

- Close this window and click **OK** to close the **Page Setup** window. To update the document area, uncheck and then recheck the **Show Print Margins** option on the **Document Panel**.

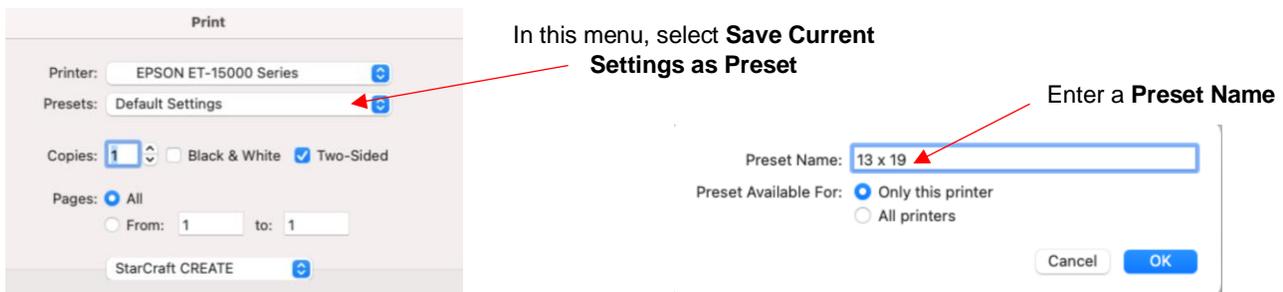

- Go to **File>Print** or activate **Print** from within the **Print+Cut** window. Select **Default Settings** and verify **Print registration marks** is enabled:

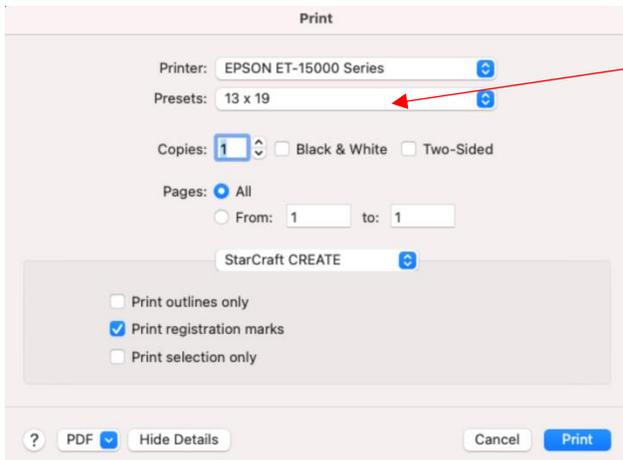

- Make other changes to your printer settings as desired by accessing the menu that defaults to **StarCraft Create**:

- Once you have the settings for your printer, go the dropdown menu next to **Default Settings** and select **Save Current Settings as Preset**. The following window opens where you can name this preset.

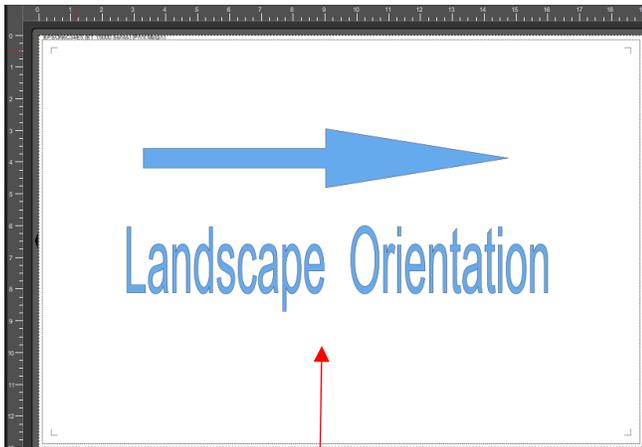

10. Click **OK** and now the **Preset** will display the new **Preset** you saved.

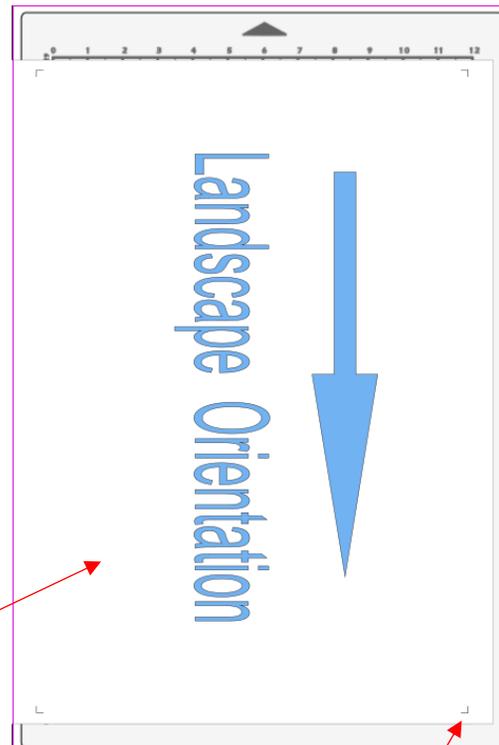

Choose this new **Preset** before printing your project

11. Print your project and place the printout onto the cutting mat in the following way (rotated 90°clockwise):

Note how the printout goes onto the mat relative to how the project is oriented in CREATE:

Blade tip will be placed here before the scan begins

12. Insert the mat into the SOLO this way. Place the blade tip over the lower right reg mark before beginning the scan:
